

ABSTRACT OF THE DISCLOSURE

The present invention relates to a method of composing a user menu by providing a shortened route to the menu the user selected among a hierarchically structured On Screen Display menu so that the user can find a menu he or she wants more conveniently. The method comprises the steps of deciding whether an item is optionally selected out of the hierarchically structured OSD menu items; deciding whether a user menu registration button for the optionally selected item is pressed; registering the selected menu with the user menu by adding an index to the currently selected item once the user menu registration button is properly pressed; displaying the registered user menu on an OSD menu if a user view menu is established; actuating a corresponding menu item when an optional item is selected among the user menu; and deleting a menu item from the user menu if a deletion button is pressed on an optionally selected item out of the user menu.
